Browsec has got you covered! You can browse the Internet at speeds of up to 100 Mbps with dedicated remote servers. Choose a default site from 40+ countries, and even match your browser time accordingly - websites won't find the difference! Select specific servers for different locations and take advantage of other smart settings. Get browsec settings instructions from the Chrome Store by clicking 'Add to Chrome'. Download and install the extension. Open the extension in the browser. Click 'Protect Me' and choose a default location from the menu. Now, you can browse anonymously. Browsing Chrome VPN is an easy way to stay safe on the internet and get the content you want. Oops something went wrong in the Chrome web store: The cancelled user promises to install Browsec with privacy, security and speed - even if you're using free browser extensions and mobile apps - but does it really offer? Can a VPN that costs nothing can bypass the harsh geoblocking of Netflix, protect your identity and personal information, and download websites quickly? This is a lot to ask for from a paid service, not to mention a free one, so Browsec has put through dozens of tests to see how it leads. I'll say this in advance: VPN is incredibly easy to use and I was able to broadcast Netflix, even on a free server. But I've seen issues of speed and privacy. Try Browsec for free for 7 days! Short on time? Here's a 1-minute summary of my fast results speeds with a premium subscription. I've seen incredibly fast speeds with every premium server. However, the free servers were clearly stifled. See the results of the speed test. Reliable access to global content - if you pay. The free version only allows access to selected servers, so many countries are out of bounds. Paid subscription lets you open more platforms. See the results of broadcast tests for more information. Fair network coverage. You can only get 4 servers with a free plan, but you can unlock 40+ with a premium subscription. Works well for online games. As long as I'm connected to a server with fast speeds, I didn't have any browser-based gaming issues. Even with a distinct plan, torrenting is no choice. Because Browsec only contains browser extensions and mobile apps, it does not protect non-browser activities. Customer service can be better. There is no live chat, so you'll have to send an email if you need help or support. See my experience with customer service. During my tests, I was amazed and happy to see that the free VPN for Browsec could open Netflix US. It also worked for HBO Max, unfortunately, nothing else. It was the best of browsec paid service, opening these streaming platforms, as well as additional Netflix libraries and BBC iPlayer. However, it can't unblock Disney+ and Halo, no matter what you try. Netflix I has tested free and paid Browsec versions of Netflix's powerful VPN blocking capabilities. To my surprise, Free and paid options for Netflix US worked, without buffering or default. I've accessed the Netflix library in the US without problems with both browsec's free servers and the feature, and the paid version of Browsec has also worked with Netflix UK and Netflix FR, but the free version wasn't because those sites are only available to discerning users. Since Browsec's paid servers were performing well, I had high hopes that the VPN would unblock more Netflix content for me. However, those hopes were dashed when Netflix Japan tried to use the Premium Subscription. Something went wrong, we have a problem with your order you'll find a lot to explore on the homepage. NSEZ-403 No matter how many times I reconnect, I couldn't get around the error messages on Netflix. I had the same problem when I tried Germany, Australia and a few other countries. Other streaming platforms have switched between free and paid US servers to try other streaming services. Both versions connected me to HBO Max, where I watched a few episodes of Doom Patrol, again with no interruptions. However, I encountered problems with Disney + and Hulu - simple Browsec can't release them, even with paid servers. Finally, I have contacted a server in the UK, which is only available with an excellent subscription. As a fan of British TELEVISION, Browsec was glad I let me stream bbc iPlayer with no issues. Watch Netflix with Browsec today! Speed - fast speeds, but only with premium Browsec subscription speeds on some of its free servers were the slowest I've ever seen, but premium servers were faster than I expected - I can easily stream and browse with no traces that can't be noticed. I was shocked when I was connected to a free server in the Netherlands, and more shocked when I tried a premium one. Browsec's stifling speeds on holland's free server was the worst I've ever seen started with a download speed of 110.59 Mbps, but the faster I could get in the Netherlands with a free server was 1.75 Mbps - this is a slowdown over 98%! At those speeds, even web browsing was painfully slow, and the broadcast was out of the question. However, when I logged on to my premium subscription and tried Holland again, its speed jumped to 87.14 Mbps. I ran several speed tests, and they all came up with constantly fast speeds. This means that Browsec clearly stifles quickly when using some of its free servers. My results were very different when I connected us and UK servers. Browsec still quickly choked on free servers, but those premium were better again, and all of the servers were free throttle, but not nearly as much as one in the Netherlands. When I switched to premium servers, my speeds jumped to 75.27 Mbps download in the US and 107.71 Mbps amazing download in the UK. Even if you are like me and can't tolerate slow download pages, you really need to get a premium plan. Torrenting — P2P is not supported at all as browsec initial offers are browser extensions, and this Torrent does not support - P2P file-sharing software works outside your browser and is not covered by these extensions. While the company also has apps for Android and iOS, I wasn't able to torrent when I tried BitTorrent, qBittorrent, and Sstwire on my Android smartphone. If P2P file sharing is important to you, scroll on Browsec. I would instead recommend nordVPN, ExpressVPN or one of the other VPN that we found safe for the Internet. Gaming — Stick with Premium servers for best results, I recommend that you avoid browsec's free gaming servers — as braking is too big. However, most of the excellent servers I tested were fast enough that I didn't experience any delays. Although I know from previous speed tests that Holland's free servers were woefully slow, I contacted a simple Flash-based MMO experience called Tanki. While the home page eventually downloaded, I could not enter the gameplay - the page just won't download. I've switched to paid servers in 20 locations, including the US, UK, Australia and Japan, to try The University of Angels, Runescape, and Nefrinter. In all cases, my speeds on Premium servers were fast enough that I enjoyed interrupt-free games. Remember: If you use a Browsec browser extension on your computer, you can only use VPN with browser-based games. This means that the computer games you download are not included, and neither the game consoles. If you're a serious player, check out our choices for the best VPN games for better alternatives. Server Network - Browsec's free VPN service provided by 40 sites is limited to servers in only four locations: the United States, the United Kingdom, Singapore and the Netherlands. Paid users have access to all Browsec servers worldwide. The VPN provides about 600 servers in more than 40 locations. Browsec gives you access to more than 40 server sites around the world while the full network provides much better access compared to the free plan, it is still fairly small compared to services that contain thousands of servers, such as ExpressVPN and CyberGhost. Browsec server sites are spread around the world, so there's a good chance of finding a nearby server for faster speeds. You can't choose specific servers or even see the city they're in - you can only choose specific countries. This means that if you need a Los Angeles, USA, or Sydney, Australia server, you'll need to connect and reconnect until (hopefully) find the one you need. Bypass Geoblocks with Browsec! Security and Privacy — Strong encryption, but privacy huge privacy concerns browsing protect your personal information and sensitive data with Encryption AES-256. This military protection is very powerful, and it will take billions of years to eliminate it. Needless to say, this means hackers, identity thieves, and other hackers won't be able to see what you're up to the internet. Ending the Browsec switch does not provide a finish key as a separate feature. Customer support explained to me when I asked via email, is basically in a job built in. Browsec confirms that if its VPN connection is to be interrupted, your Internet connection will simply stop working. I put this explanation to the test by switching servers while I was playing an online game. My game temporarily stopped until the new server connected, and then I was free to continue playing. Split Split Split Split is available with this VPN — it's called smart settings in the interface, and lets you choose websites that use VPN and those you don't use. Browsec calls the tunnel partition feature smart settings using it easy: simply click smart settings, and then enter a domain name upwards. From there, you will indicate whether a website should always use a VPN (on) or not using VPN at all (off). Leak Protection used three different services to check if Browsec displays my personal details. A leak test from IP Leak showed that my IP address was hidden. It also showed that WebRTC data from the browser was also contained so that no information appeared about me or my site. A leak test showed that Browsec did not leak any information about my real DNS leak test and additional WebRTC scans both showed information from Italy, proving that Browsec was protecting my data. Browsec Privacy does not make any claims about being a VPN without records. In fact its website states that it does not collect personal information about you, although it says the information is stored in total - meaning mixed with the information of all other users. A VPN is not clear about the personal details you collect. Instead, it uses ambiguous terms such as, some information from your web browser and/or client program. What is most disturbing is that it also says that it will not publish information to third parties, unless it is required by legal law enforcement requests. Since many people use VPN to prevent this type of intrusion, this information is very disturbing. Browsec is not located in the country of 14 Eyes. But it is based in Russia, a country that has its own problematic policies regarding internet freedom. Simultaneous device connections — Use up to 5 browsers in Once you can install the free version of Browsec on as many devices as you want. When you use browser extensions, you don't even need to sign in, so there's no tracking of any accounts. Allows you to make up to 5 connections simultaneously with a paid subscription. This means that you can log on to up to 5 different browsers or mobile devices at the same time. Device compatibility — Only browsers and mobile devices are compatible with most browsers and mobile devices. It offers browser extensions for Google Chrome, Mozilla Firefox, Microsoft Edge, and Opera browser. It also has apps for Android and iOS devices, such as smartphones and tablets. If you are a Mac user, you will notice a big exception here is Safari - Browsec does not have an extension for this Right now. Browsec does not have a desktop application. While its browser and mobile phone options work well, the lack of a desktop application is a big drawback. While Testing on a computer, I couldn't use a VPN for internet, computer games or Skype because all these activities take place outside the browser. You won't find a router application with Browsec, nor any way to configure access manually. This means you can't use the service to protect other devices that support the Internet, such as game consoles and smart TVs. Details of features number of countries with 5 servers 80 IP addresses 80 Do you keep VPN records? Does vpn not include a kill key? There are no hardware for each license 5
